#_ly(float): float
#_uy(float): float
Note:
different implementation of optimisation algorithms that are abstracted to a level so they only use 4 parameters: initial guess, maximum number of iteration, minimum error to terminate and the function to optimise
the name of the class is distinct where {NAME} is substituded

drawGaussKernel(parameter, ggb):bool
drawGsinKernel(parameter, ggb): bool
saveExpObject(obj, filename): bool
loadExpObject(filename): dict
plotApprox3D(kernel, parameter, ID, uD)
Note:
set of classes where each class represents a PDE 0...N of the testbed
for every run in the epxeriment a new object is created
