Note:

set of classes where
each class represents a
PDE 0...N of the testbed

for every run in the
experment a new object
is created

Note:

different implementation of
optimisation algorithms that
are abstracted to a level so
they only use 4 parameters:
initial guess, maximum
number of iteration, minimum
error to terminate and the
function to optimise

the name of the class is
distinct where {NAME} is
substituted
